Getting Started

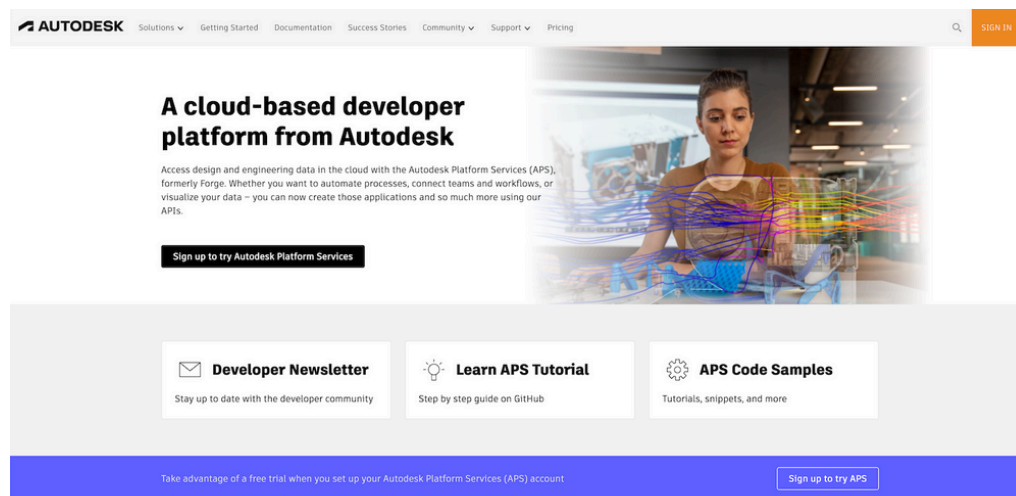

Here's a couple of things you want to do before building your first [Autodesk Platform Services](#) application.

Create an account

If you don't have an APS account yet, sign up for one on <https://aps.autodesk.com>.

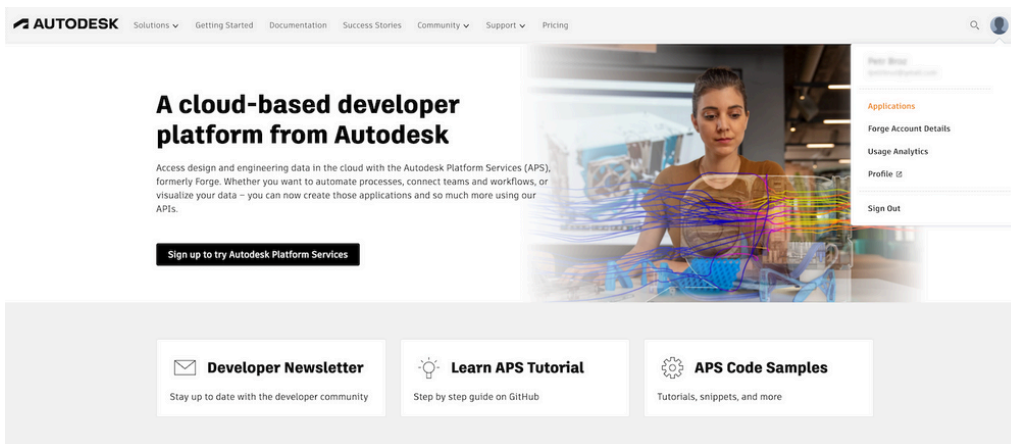

**TIP**

You can take advantage of a trial subscription that is valid for 3 months.

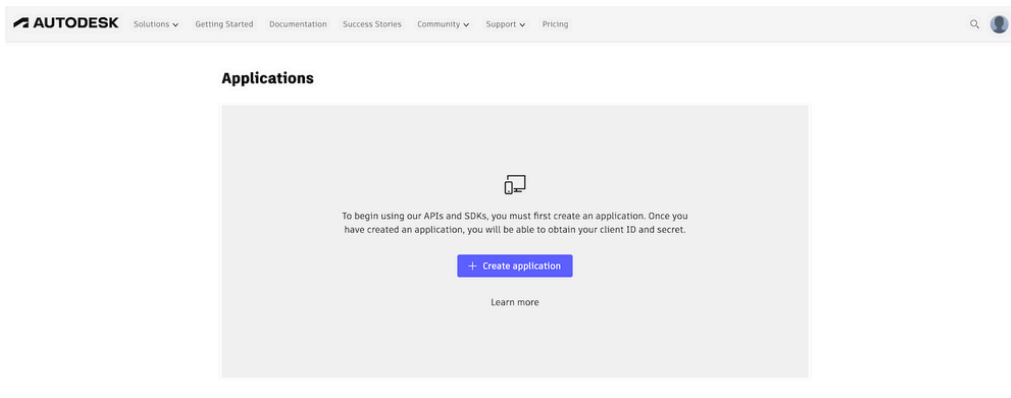

Create app credentials

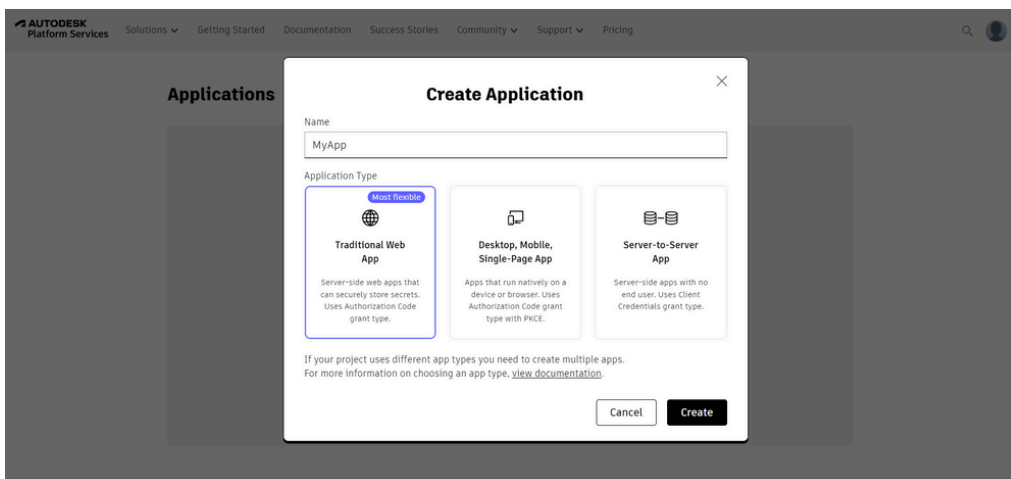

In order to authenticate ourselves to the APS platform, we will need to generate *app credentials* (specifically, a *client ID* and *client secret*) for our application. After logging into the developer portal, go to your profile menu in the top-right corner, and click on *Applications*:

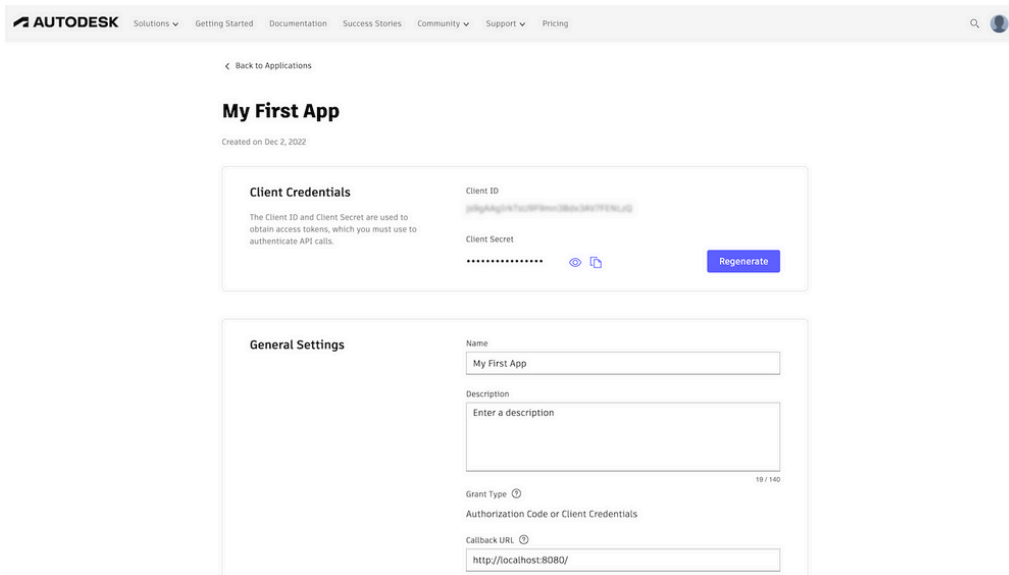

Next, click on the *Create application* button:

Enter the name of your application. Select the type of application that applies to you, and click the *Create* button:

And your application is now ready. Let's store your *Client ID* and *Client Secret* credentials as we will need these soon!

My First App
Created on Dec 2, 2022

Client Credentials
The Client ID and Client Secret are used to obtain access tokens, which you must use to authenticate API calls.

General Settings

Name
My First App

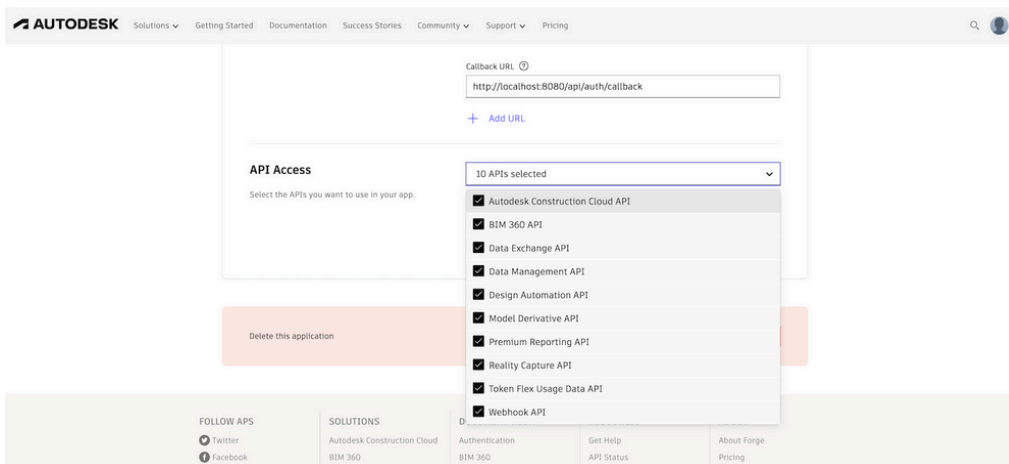

Description
Enter a description

Grant Type [?](#)

Authorization Code or Client Credentials

Callback URL [?](#)
http://localhost:8080/

Finally, set the *Callback URL* under *General Settings* to <http://localhost:8080/api/auth/callback>, and enable the APIs you want your application to have access to. Unless you have any specific reason for limiting your application's access to the different services, enable everything.

Callback URL [?](#)
http://localhost:8080/api/auth/callback

[+ Add URL](#)

API Access
Select the APIs you want to use in your app.

10 APIs selected

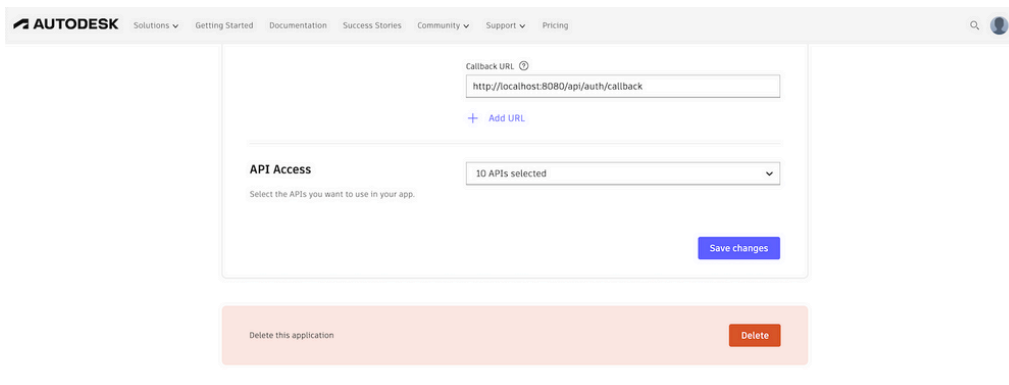

- ☒ Autodesk Construction Cloud API
- ☒ BIM 360 API
- ☒ Data Exchange API
- ☒ Data Management API
- ☒ Design Automation API
- ☒ Model Derivative API
- ☒ Premium Reporting API
- ☒ Reality Capture API
- ☒ Token Flex Usage Data API
- ☒ Webhook API

Delete this application

⚠ CAUTION

Pay close attention to the *Callback URL*. This is the address your application's users will be redirected to after logging in with their Autodesk credentials. It can be any arbitrary URL but it has to match exactly the URL your server application expects. In our tutorials we will always use the same address: <http://localhost:8080/api/auth/callback>.

Finally, update the application by clicking on the *Save changes* button, and you're all set!

Provision access in other products

In certain cases it is possible for your application to integrate with other APS-based products such as [Autodesk Construction Cloud](#), or [Autodesk BIM 360](#). We leverage this capability in the Hubs Browser and ACC Administrator tutorials where you can learn about accessing designs from [Autodesk Docs](#), [BIM 360 Docs](#), or [Fusion Teams](#).

However, some of these products must *provision access* for a specific APS application based on its client ID. Follow the steps below for any specific product you would like to integrate your application with.

! INFO

If you are *not* planning to integrate your application with other products for now, you can skip the rest of this page and come back to it later when needed.

**Autodesk
Construction Cloud**

**Autodesk BIM
360**

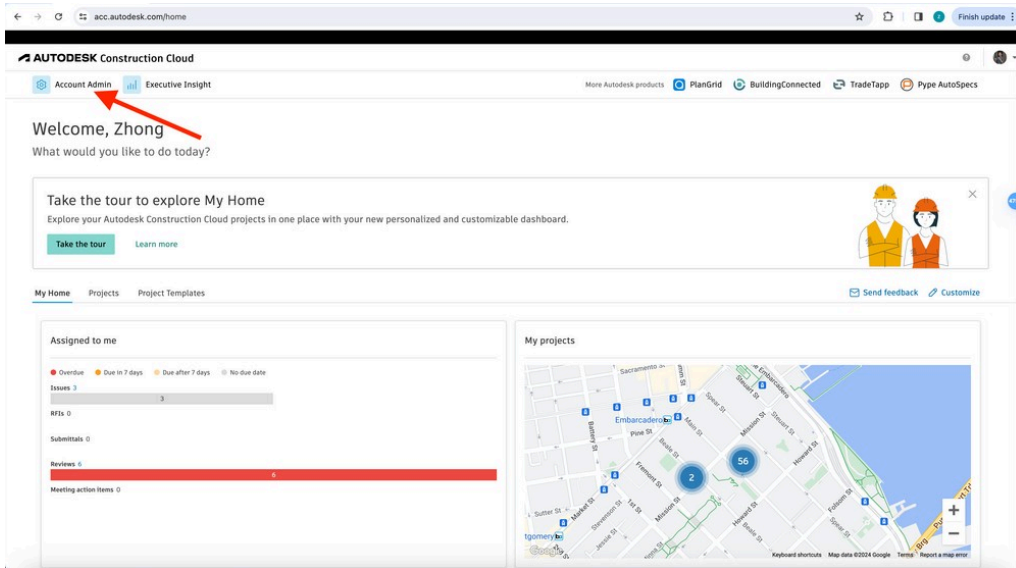

**Autodesk Fusion
Team**

! CAUTION

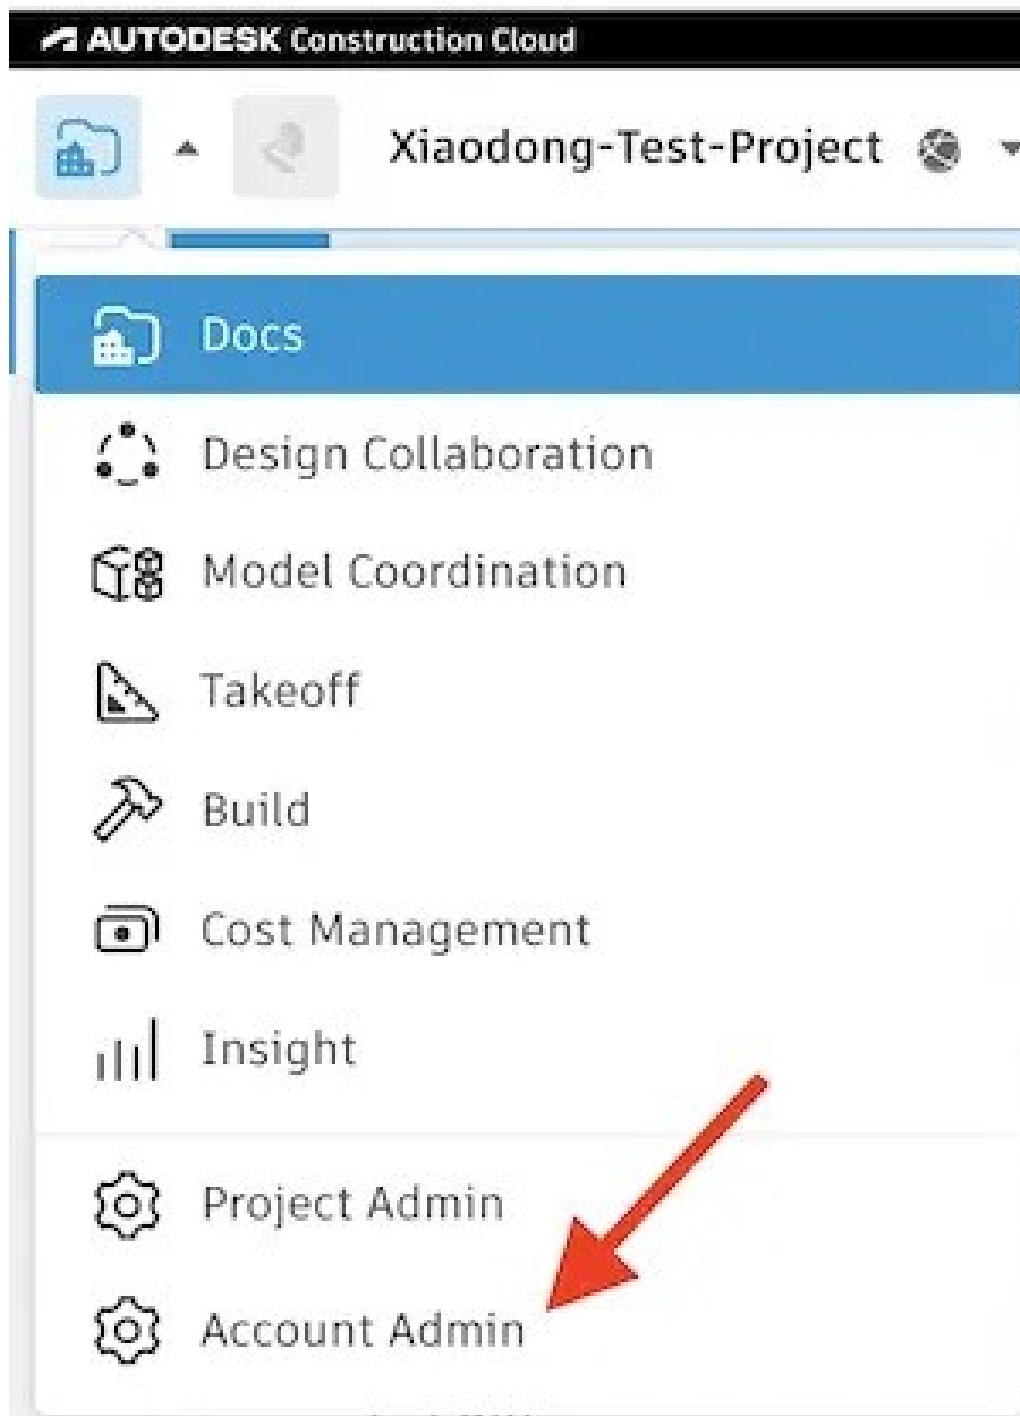

Make sure you have *admin* access to an Autodesk Construction Cloud (ACC for short) account

1. Log into your ACC account, and navigate to *Account Administration*

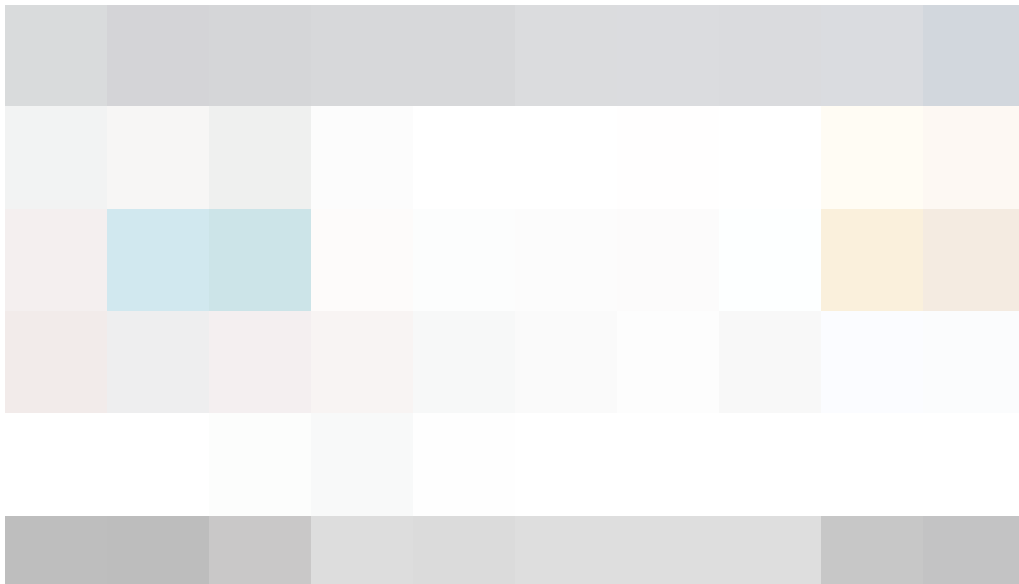

- From the overview of projects

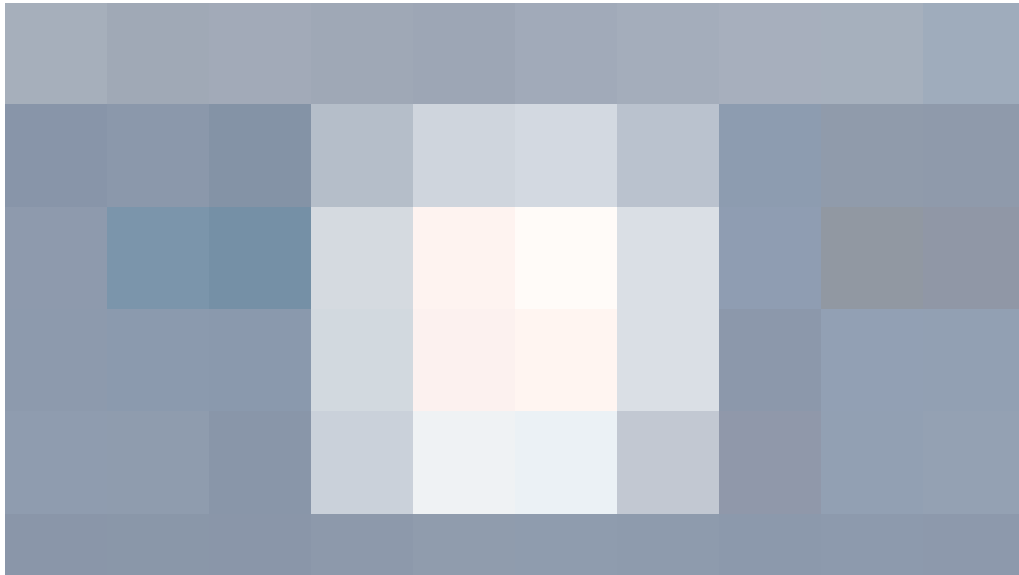

- From the user interface of a specific project

2. On the *Account Admin* page, go to *Custom Integrations*, use the *Add Custom Integration* button on the top to add a custom integration.

3. On the *Add custom integration* dialog page, fill out the *Client ID*, *Custom integration name* and *Description* fields.

4. When ready, hit the *Add* button

After completing the process, your application will be able to use different APS services such as [Data Management API](#) or [ACC API](#) to access information from all projects under this ACC account.
