

The **AEM SPA Editor SDK** is a set of open-source JavaScript libraries that enabled in-context editing of Single Page Applications (SPAs) within Adobe Experience Manager (AEM). [🔗](#)

Note: The **AEM SPA Editor SDK** has been deprecated with the AEM as a Cloud Service 2025.01 release and AEM 6.5.23 release. Adobe encourages the use of the new, framework-agnostic **Universal Editor** for all new projects. [🔗](#)

Overview of the SPA Editor SDK

The primary purpose of the SPA Editor SDK was to bridge the gap between client-side rendered SPAs (built with frameworks like React and Angular) and AEM's traditional server-side authoring interface. [🔗](#)

- **In-Context Editing:** It allowed content authors to use AEM's visual drag-and-drop editor to modify content within the SPA, rather than relying on form-based interfaces or code deployments for simple content changes.
- **Component Mapping:** The SDK worked by creating a one-to-one mapping between AEM components (which export content as JSON via AEM's Content Services API) and the corresponding SPA components (which consume the JSON and render the content client-side).
- **Framework Support:** It provided out-of-the-box support for React and Angular frameworks.
- **Workflow:** When an author made an edit in AEM, the editor communicated the change via a JSON model, which the SDK then used to update the relevant component in the running SPA without a full page refresh. [🔗](#)

Migration to the Universal Editor

For new projects, Adobe recommends the **Universal Editor**, which is designed to be a versatile, framework-agnostic editor for both headless and hybrid implementations. The Universal Editor does not require a specific SDK; instead, it uses a minimal instrumentation of the application's DOM. [🔗](#)

Existing projects using the SPA Editor can continue to do so, but no further enhancements or updates will be provided for the SDK. For guidance on migrating or starting new projects with the Universal Editor, please refer to the official [Adobe Experience League documentation](#).
