

AEM Content Fragments are **channel-agnostic, structured content assets** (text, images, data) created independently of page design to enable omnichannel reuse and headless delivery. Based on user-defined Content Fragment Models, they support variations for different channels, versioning, and JSON export. They are managed within the AEM DAM. [🔗](#)

This video demonstrates how to create and use content fragments in AEM:

Key Aspects of AEM Content Fragments:

- **Structure & Models:** Content Fragments are defined by Content Fragment Models, which structure the data (e.g., text, numbers, boolean, date).
- **Channel-Neutral:** Unlike Experience Fragments, these focus on pure content without layout or design, making them ideal for multi-channel delivery.
- **Variations:** Users can create variations of the same content for different channels or scenarios (e.g., a shorter version for mobile).
- **Headless Capability:** With the JSON exporter and Content Services, they enable delivering content to non-AEM applications, such as mobile apps or IoT devices.
- **Integration:** They are created, managed, and stored as assets within the AEM Digital Asset Manager (DAM). [🔗](#)

Workflow for Content Fragments:

1. **Define Model:** Create a Content Fragment Model (e.g., "Article", "Product").
2. **Create Fragment:** Author content based on the model in the Assets console.
3. **Create Variations:** Generate channel-specific versions as needed.
4. **Use on Pages:** Add the Content Fragment component to AEM pages to display the content. [🔗](#)

Content Fragments vs. Experience Fragments:

- **Content Fragments:** Structured, text-based content, no design, channel-agnostic.
- **Experience Fragments:** Pre-designed, layout-driven content blocks for websites. [🔗](#)
