

No, Experience Fragment (XF) export JSON is **not equivalent** to Content Fragment (CF) JSON, as they serve different purposes within AEM. Experience Fragments (XF) contain fully laid-out content (HTML, CSS, components). Content Fragments (CF) are pure, structured editorial content without design, which are best for headless delivery. [🔗](#)

- **Experience Fragments JSON (Target/Headless):** Represents a structured, laid-out component hierarchy, often including visual layout information. When exported to Adobe Target as JSON, it is intended to populate pre-defined, structured offers.
- **Content Fragments JSON (Headless):** Represents raw data structure (fields, text, numbers, dates). It is designed for consumption by decoupled applications through the Content Services API, focusing entirely on data.
- **Key Differences:** While both can be exported as JSON, XFs represent "content+layout," whereas CFs represent "pure data". [🔗](#)

Usage Distinctions:

- Use **Content Fragments** for structured data (e.g., product details, blog content) consumed by multiple platforms.
- Use **Experience Fragments** to reuse visual, laid-out components (e.g., a website header/footer) across different pages or channels.
