

Experience Fragments exported for [Adobe Target](#) in headless scenarios deliver structured content (text, images, links) via JSON, allowing non-AEM applications to consume content personalized via Target. The JSON structure typically includes metadata about the variation, component IDs, and the content fields. [🔗](#)

json

```
{
  "properties": {
    "fragmentTitle": "Holiday Promo Fragment",
    "variationName": "Master",
    "description": "JSON Export for Headless Target"
  },
  "elements": {
    "headline": {
      "type": "text",
      "value": "Get 20% Off Your Next Order"
    },
    "heroImage": {
      "type": "image",
      "value": "/content/dam/wknd/holiday-promo.jpg",
      "alt": "Holiday Promotion Banner"
    },
    "ctaText": {
      "type": "text",
      "value": "Shop Now"
    },
    "ctaLink": {
      "type": "text",
      "value": "/content/wknd/us/en/shop.html"
    }
  }
}
```

Key Components of the JSON

- **elements** : Contains the core content structured by component type (e.g., text, image).
- **links** : References to assets like images (e.g., `/content/dam/...`).
- **Target Integration**: The JSON is generated using specialized Sling selectors, often replacing HTML, when the cloud configuration is set to Adobe Target.
- **Customization**: The structure can be further customized by defining a custom Experience Fragment component and updating its Sling Model to change the export format.
