

To create a slide-up animation for button text using pure CSS, you need a container element with `overflow: hidden` and a nested element (like a `<span>` or `<div>`) that contains the text and whose position you can animate on hover. [Coderwall +2](#)

HTML Structure

The structure involves a main button container and two text elements, one for the initial state and one for the hover state, wrapped in an inner container you will animate. [🔗](#)

html

```
<button class="slide-button">
  <div class="text-container">
    <span class="default-text">Default Text</span>
    <span class="hover-text">Hover Text</span>
  </div>
</button>
```

CSS Styling

Apply the necessary styling to position and animate the text elements. [Hashnode +1](#)

CSS

```
.slide-button {
  /* Button styling */
  background-color: #0d7377;
  border: none;
  border-radius: 25px;
  color: white;
  cursor: pointer;
  height: 45px;
  overflow: hidden; /* This hides the text outside the button area */
  position: relative;
  width: 180px;
}

.text-container {
  /* Container for both texts, positions them vertically */
  position: absolute;
  width: 100%;
  transition: transform 0.3s ease-out; /* Smooth animation for the transform property */
}
```

```
.default-text,  
.hover-text {  
  /* Styling for individual text spans */  
  display: block;  
  height: 45px; /* Same as button height for alignment */  
  line-height: 45px; /* Center text vertically */  
  text-align: center;  
  width: 100%;  
}  
  
.hover-text {  
  /* Initially place the hover text below the default text */  
  transform: translateY(100%);  
}  
  
/* Hover effect: Move the text container up */  
.slide-button:hover .text-container {  
  transform: translateY(-100%); /* Moves the default text up and brings the hover text in  
}
```

This implementation uses the `transform: translateY()` property for a smooth, hardware-accelerated animation effect when the user hovers over the button. You can adjust the `transition-duration` and `transition-timing-function` for different animation speeds and effects, as detailed in resources on cubic-bezier.com or the [MDN Web Docs](https://developer.mozilla.org/en-US/docs/Web/CSS/transition).
