

How to get the query parameters from URL in Next JS?

January 5, 2023 by [Source Freeze](#) — [Leave a Comment](#)

In nextjs we can easily get the query params with the use of `useRouter()` that we can import from `'next/router'` then assign `useRouter()` to the router variable after that using `router.query` we can get the exact query string values. if you are passing multiple queries also we can get the values from `router.query`.

HOW TO GET THE QUERY PARAMETERS FROM URL IN NEXT JS?

SOURCE FREEZE

[HOME](#)[IOS](#)[SWIFT](#)[CROSS-PLATFORM](#)[ABOUT](#)[CONTACT](#)

below code.

[📄 pass query params](#)

```
1 import Link from "next/link";
2
3 <Link href={{ pathname: '/search', query: { keyword: 'source freeze' } }}>
4
5 <a>Search</a>
6
7 </Link>
```

Then next we need to get the query params from the URL, here we are three options to get the query params, please refer to the below options.

1. In Component
2. Using `getServerSideProps` Function
3. In API Routes

First, we can see the option to get query params in the component

Access Query Params in the Component

To get the query params in the component first we need to import the `useRouter` from the 'next/router', then create a variable `router` and assign the `useRouter` to that variable, then using `router.query` we can able to get the exact params, used anywhere on the page.

[📄 Get query params in the component](#)

```
1 import { useRouter } from 'next/router';
2
3 function Search(props) {
4   const router = useRouter();
5
6   // Get the query parameter from the URL
7 }
```

SOURCE FREEZE

[HOME](#)[IOS](#)[SWIFT](#)[CROSS-PLATFORM](#)[ABOUT](#)[CONTACT](#)

```
14   );  
15   }  
16   export default Search;
```

Also if you have passed multiple keywords we can easily access them like the one below.

JavaScript

```
1  import { useRouter } from 'next/router';  
2  
3  function Search(props) {  
4    const router = useRouter();  
5  
6    // Get the query parameter from the URL  
7    const { keyword1, keyword2 } = router.query;  
8  
9    return (  
10     <div>  
11       The Search Keyword {keyword1} {keyword2}.  
12     </div>  
13   );  
14 }  
15  
16 export default Search;
```

Next, we can see the option how to get the query params using `getServerSideProps` function

How to Get Query Parameters In a `getServerSideProps`

Using `getServerSideProps` function in Next.js we can generate server-side rendered pages, also it receives a context object as an argument, which contains a query property that holds the query parameters for that page.

We can access the query parameters by accessing the context value below.

SOURCE FREEZE

[HOME](#)[IOS](#)[SWIFT](#)[CROSS-PLATFORM](#)[ABOUT](#)[CONTACT](#)

If we want to access multiple query parameters, we can access them like the one below.

JavaScript

```
1 export async function getServerSideProps({ context }) {  
2   const queryparam1 = context.param1;  
3   const queryparam2 = context.param2;  
4   const queryparam3 = context.param3;  
5 }
```

Accessing Query Params In API Routes

We can also access query params by API route, we will get the req object property by destructuring the request object we can access the query params.

Here's an example to access the query params in the API routes

JavaScript

```
1 import { NextApiRequest, NextApiResponse } from 'next';  
2  
3 export default (req: NextApiRequest, res: NextApiResponse) => {  
4   const { query } = req;  
5   const queryParams = query.paramName;  
6  
7   res.status(200).json({ queryParams });  
8   };
```

Conclusion:

So there are three methods we can access the query params in NextJS

1. In the component, we can `useRouter()` hook to access query parameters.
