

To debug "400 Bad Request" errors using `fetch-intercept`, log the request details (URL, headers, body) before the request and the response status/body after. A 400 error indicates the server rejected the request due to malformed syntax, invalid headers, or missing body data. Inspect the body of the 400 response as servers often send details there.  Medium +4

Logging Request/Response with `fetch-intercept`

Use the following pattern to capture details of outgoing requests and incoming 400 responses:

javascript

```
import fetchIntercept from 'fetch-intercept';

const unregister = fetchIntercept.register({
  request: function (url, config) {
    // Log outgoing request
    console.log('--- Request Intercepted ---');
    console.log('URL:', url);
    console.log('Method:', config.method);
    console.log('Headers:', config.headers);
    console.log('Body:', config.body);
    return [url, config];
  },

  response: async function (response) {
    // Log response if it's 400
    if (response.status === 400) {
      // Clone response to read body without damaging original request
      const clonedResponse = response.clone();
      const body = await clonedResponse.text();
      console.error('--- 400 Bad Request Detected ---');
      console.error('URL:', response.url);
      console.error('Error Body:', body);
    }
    return response;
  }
});

// Unregister later if needed
// unregister();
```

Common Causes for 400 Bad Request

- **Malformed Body:** JSON structure is incorrect, or required fields are missing in the `POST/PUT` body.
- **Too Large Cookies:** Header size is too big, causing the server to reject it.
- **Invalid Headers:** Incorrect `Content-Type` (e.g., sending JSON without `application/json`).
- **Authentication/Token Issue:** A bad JWT token may cause a 400 or 401.  Medium +4

Debugging Steps

1. **Check Console Logs:** Look for the logged URL and Body to see what the server deems invalid.
2. **Inspect Network Tab:** Check the Chrome DevTools Network tab.
3. **Validate JSON:** Ensure any body content is properly stringified.
4. **Clear Cookies:** Clear site cache and cookies to ensure no corrupted data is causing the 400.  Medium +4
