

In a Next.js application, there are three primary ways to share a PDF via WhatsApp, depending on whether you want a simple link-sharing approach, a native sharing experience on mobile, or a server-side automated message.

1. Simple Link Sharing (Universal)

The most common web-based approach is to send a pre-filled [WhatsApp](#) message containing a **publicly accessible URL** to your PDF. Users click the link in WhatsApp to view or download the file.  Pushwoosh +1

- **How it works:** You use the WhatsApp "Click to Chat" API.
- **Example Code:**

javascript

```
const sharePdf = () => {  
  const pdfUrl = "https://yourdomain.com";  
  const message = `Check out this report: ${pdfUrl}`;  
  const whatsappUrl = `https://wa.me${encodeURIComponent(message)}`;  
  window.open(whatsappUrl, '_blank');  
};
```

Use code with caution.

2. Native Web Share API (Mobile Web)

If your users are primarily on mobile browsers, you can use the **Web Share API**. This opens the device's native share sheet, allowing the user to select WhatsApp and attach the actual file rather than just a link. 

- **Requirement:** The PDF must be fetched as a `File` object first.
- **Implementation Snippet:**

javascript

```
const handleNativeShare = async (blob, fileName) => {  
  const file = new File([blob], fileName, { type: 'application/pdf' });  
  
  if (navigator.canShare && navigator.canShare({ files: [file] })) {
```

```
try {
  await navigator.share({
    files: [file],
    title: 'Your Document',
    text: 'Sharing a PDF via WhatsApp',
  });
} catch (error) {
  console.error("Sharing failed", error);
}
} else {
  // Fallback to link sharing or download
}
};
```

Use code with caution.

3. WhatsApp Business API (Automated/Server-side)

For enterprise-level automation where the app sends the PDF directly to a user's number without their manual interaction, you must use the **WhatsApp Business API** or a third-party service like [Pabbly](#). 

- **Key Requirements:**
 - A pre-approved **Message Template** with a "document" header.
 - The PDF must be hosted at a **publicly accessible URL**.
- **Next.js API Route Example:**

javascript

```
// Example POST request to a WhatsApp API provider
const response = await fetch('https://provider.com', {
  method: 'POST',
  body: JSON.stringify({
    to: "1234567890",
    type: "template",
    template: {
      name: "your_template_name",
      components: [{
```

```
    type: "header",
    parameters: [{ type: "document", document: { link: "https://example.com/file.pdf" }
  }]
}
})
});
```

Use code with caution.

Important Limitations

- **File Size:** WhatsApp has a standard document size limit of **100 MB**.
- **Browser Support:** The native Web Share API (method 2) works best on mobile browsers (Safari/Chrome on Android/iOS) but has limited support on desktop browsers.
- **Privacy:** Always ensure PDFs containing sensitive data are hosted on secure, temporary URLs if using the link-sharing method.  www.pdf2go.com +3
