

Object.fromEntries()

The `Object.fromEntries()` method transforms a list of key-value pairs into an object.

Try it

JavaScript Demo: Object.fromEntries()

```
1 const entries = new Map([
2   ['foo', 'bar'],
3   ['baz', 42]
4 ]);
5
6 const obj = Object.fromEntries(entries);
7
8 console.log(obj);
9 // expected output: Object { foo: "bar", baz: 42 }
10
```

Run ›

Reset

Syntax

Object.fromEntries(iterable)

📋

Parameters

`iterable`

An iterable such as [Array](#) or [Map](#) or other objects implementing the [iterable protocol](#).

Return value

The `Object.fromEntries()` method takes a list of key-value pairs and returns a new object whose properties are given by those entries. The *iterable* argument is expected to be an object that implements an `@@iterator` method, that returns an iterator object, that produces a two element array-like object, whose first element is a value that will be used as a property key, and whose second element is the value to associate with that property key.

`Object.fromEntries()` performs the reverse of [Object.entries\(\)](#).

Examples

Converting a Map to an Object

With `Object.fromEntries`, you can convert from [Map](#) to [Object](#):

```
const map = new Map([ ['foo', 'bar'], ['baz', 42] ]);
const obj = Object.fromEntries(map);
console.log(obj); // { foo: "bar", baz: 42 }
```

Converting an Array to an Object

With `Object.fromEntries`, you can convert from [Array](#) to [Object](#):

```
const arr = [ ['0', 'a'], ['1', 'b'], ['2', 'c'] ];
const obj = Object.fromEntries(arr);
console.log(obj); // { 0: "a", 1: "b", 2: "c" }
```

Object transformations

With `Object.fromEntries`, its reverse method [Object.entries\(\)](#), and [array manipulation methods](#), you are able to transform objects like this:

```
const object1 = { a: 1, b: 2, c: 3 };

const object2 = Object.fromEntries(
```

```
Object.entries(object1)
  .map(([ key, val ]) => [ key, val * 2 ])
);

console.log(object2);
// { a: 2, b: 4, c: 6 }
```
