To calculate the time difference between a given time and the current time in JavaScript, **subtract the two date objects to get the difference in milliseconds, then divide by the appropriate conversion factor.** 🏆 Stack Overflow +1

🕒 Core Formula

When you subtract one [JavaScript Date object](#) from another, JavaScript automatically coerces them into timestamps (milliseconds since January 1, 1970). © CoreUI

javascript

```
const givenTime = new Date('2026-06-10T12:00:00'); // Your given date/time
const currentTime = new Date();                    // Current date/time

const differenceInMs = currentTime - givenTime;     // Difference in milliseconds
```

Use code with caution.

📁 Quick Conversion Code Snippets

Depending on what time unit you need, use these basic conversions: © CoreUI +1

1. Difference in Seconds 🏆 Stack Overflow

javascript

```
const diffInSeconds = Math.floor((currentTime - givenTime) / 1000);
```

Use code with caution.

2. Difference in Minutes [🔗](#)

javascript

```
const diffInMinutes = Math.floor((currentTime - givenTime) / (1000 * 60));  
console.log(`${diffInMinutes} minutes`);
```

Use code with caution.

3. Difference in Hours [🔗](#) Stack Overflow

javascript

```
const diffInHours = Math.floor((currentTime - givenTime) / (1000 * 60 * 60));  
console.log(`${diffInHours} hours`);
```

Use code with caution.

4. Difference in Days [🔗](#) synyx.de +1

javascript

```
const diffInDays = Math.floor((currentTime - givenTime) / (1000 * 60 * 60 * 24));  
console.log(`${diffInDays} days`);
```

Use code with caution.

🔧 Complete Reusable Function (Breakdown Breakdown)

If you want a breakdown showing exact **Days**, **Hours**, **Minutes**, and **Seconds** elapsed, use

javascript

```
function getTimeDifference(pastTime) {  
    const given = new Date(pastTime);  
    const now = new Date();  
  
    // Use Math.abs() to handle both future and past dates gracefully  
    let diffInMs = Math.abs(now - given);  
  
    // Time calculations for days, hours, minutes and seconds  
    const days = Math.floor(diffInMs / (1000 * 60 * 60 * 24));  
    diffInMs %= (1000 * 60 * 60 * 24);  
  
    const hours = Math.floor(diffInMs / (1000 * 60 * 60));  
    diffInMs %= (1000 * 60 * 60);  
  
    const minutes = Math.floor(diffInMs / (1000 * 60));  
    diffInMs %= (1000 * 60);  
  
    const seconds = Math.floor(diffInMs / 1000);  
  
    return { days, hours, minutes, seconds };  
}  
  
// Example usage:  
console.log(getTimeDifference("2026-06-09T10:30:00"));  
// Output format: { days: 1, hours: 3, minutes: 47, seconds: 15 }
```

Use code with caution.

Modern Alternative: Relative Time Formatting [↗](#)

Ask anything

```
const rtf = new Intl.RelativeTimeFormat('en', { numeric: 'auto' });

const hoursAgo = Math.floor((new Date('2026-06-10T10:00:00') - new Date()) / (1000 * 60 * 60));

// This will automatically render localized text like "2 hours ago"
console.log(rtf.format(hoursAgo, 'hour'));
```

Use code with caution.

Would you like help adapting this into a specific **framework** (like React or Vue), or do you need to calculate the difference from a **string format** (like "14:30") without a specific date attached? 🙋 Stack Overflow +2
