

To generate an MD5 hash in JavaScript, you can use the **native `crypto` module in Node.js** without any installations. If you are working in a **web browser**, you must use a lightweight library like `js-md5` or the Web Crypto API (which natively supports SHA-256 but requires a library or manual implementation for MD5).  NPM +3

Node.js (Native Approach)

Node.js includes a built-in `crypto` module that generates hashes efficiently.  DEV Community +1

javascript

```
const crypto = require('crypto');

function generateMD5(text) {
  return crypto.createHash('md5').update(text).digest('hex');
}

console.log(generateMD5("Hello World"));
// Output: b10a8db164e0754105b7a99be72e3fe5
```

Use code with caution.

Web Browser (Using a Library)

Because browsers do not natively provide a simple MD5 API, using the [js-md5 library on GitHub](#) is the most common approach.  GitHub +1

1. Via CDN (Quick setup for HTML)

Include the script in your HTML file via [cdnjs](#) or unpkg: 

html

```
<script src="https://cloudflare.com"></script>
<script>
  const hash = md5("Hello World");
```

```
console.log(hash);  
// Output: b10a8db164e0754105b7a99be72e3fe5  
</script>
```

Use code with caution.

2. Via NPM (For React, Vue, or Bundlers) [🔗](#)

Install the package: [📦 NPM +1](#)

bash

```
npm install js-md5
```

Use code with caution.

Import and use it in your code: [📦 NPM +1](#)

javascript

```
import { md5 } from 'js-md5';  
  
const hash = md5("Hello World");  
console.log(hash);
```

Use code with caution.

⚠️ Security Warning

MD5 is **cryptographically broken** and vulnerable to collision attacks. Do not use it to hash passwords or secure sensitive data. [🐞 Datadog Docs +1](#)

- Use MD5 only for non-critical tasks like **data integrity checks** or **generating Gravatar URLs**.
- For security-critical applications, use **SHA-256** via the browser's native `crypto.subtle.digest()` or a library like `bcrypt`. [🌐 Rublon +4](#)

Would you like to see how to implement **SHA-256** natively in the browser instead, or do you specifically need **MD5** for a legacy integration?

js-md5 - NPM

9 Oct 2023 — Usage. You could use like this: md5('Message to hash'); var hash = md5. create(); hash. update('Message to hash'); hash. hex(); //
