Deploying Your Next.js App

1 2 3 4 5 **6** 7

Other Hosting Options

Next.js can be deployed to any hosting provider that supports Node.js.

If you've followed the instructions so far, your `package.json` should have the following `build` and `start` scripts:

```
{
  "scripts": {
    "dev": "next",
    "build": "next build",
    "start": "next start"
  }
}
```

In your own hosting provider, run the `build` script once, which builds the production application in the `.next` folder.

```
npm run build
```

Monitoring your Core Web Vitals

After building, the `start` script starts a Node.js server that supports hybrid pages, serving both statically generated and server-side rendered pages, and API Routes.

```
npm run start
```

Tip: You can customize the `start` script in `package.json` to accept a `PORT` parameter by updating it as: `"start": "next start -p $PORT"`.

That's it! If you have questions about deploying Next.js, you can ask our community on [GitHub Discussions](#).
