

`sessionStorage` is cleared automatically as soon as you close the specific browser tab. Because closing the entire browser inherently closes all of its tabs, doing so will also wipe out the data.  MDN Web Docs +1

Understanding how the [MDN Web Docs Window: sessionStorage](#) lifecycle behaves across different actions can help prevent unexpected data loss:  MDN Web Docs

✗ What Clears Session Storage

- **Closing the Tab:** The data is immediately and permanently wiped for that specific tab session.
- **Closing the Browser Window:** This terminates the top-level browsing context and clears the data.
- **Manual Code**
Execution: Calling `sessionStorage.clear()` or `sessionStorage.removeItem('key')` via JavaScript.  MDN Web Docs +4

What Does NOT Clear Session Storage

- **Refreshing the Page:** Data safely survives normal page reloads, F5 refreshes, and form submissions.  MDN Web Docs +3
- **Navigating Away:** If you click a link to go to another website in the same tab, and then click the "Back" button, the data is still there.
- **Restoring a Closed Tab:** Many modern browsers feature an "Undo Close Tab" shortcut (Ctrl + Shift + T). If used immediately, the browser often restores the exact tab session along with its `sessionStorage`.  MDN Web Docs +3

Behavior Across Multiple Tabs

- **Opening a New Tab:** If you open a completely new, blank tab and type in the same URL, it will have a completely empty, separate `sessionStorage`.
- **Duplicating a Tab:** If you right-click a tab and choose "Duplicate" (or if a page uses `window.open()`), the browser will copy the current `sessionStorage` into the new tab. However, once copied, these two tabs operate independently—changes in one will not sync to the other.  MDN Web Docs +3

If you need data to persist even after closing tabs and windows, you should look into MDN Web Docs Window: `localStorage` instead, which persists indefinitely until intentionally cleared.  DEV Community

Are you experiencing an **issue where data disappears unexpectedly**, or are you trying to **design a login/session flow** for your web application?
